Introductory Signal Processing - Example Report

Similarity to indexed sources	**33.1%**
Indexed sources available	**1**
Matched words	**50**
Submitted words	**151**
AI writing assessment	**Not assessed**
AI model score	**Not assessed**

Matched sources

1. **Fundamentals of Signal Processing** — 50 matched words; 33.1% of submission

Representative overlaps

Fundamentals of Signal Processing — 50 words

Digital signal processing allows engineers to manipulate discrete sequences using mathematical operations. A discrete time signal may represent sampled measurements from a physical instrument. The sample rate determines the time interval between adjacent measurements, and aliasing occurs when the sampling frequency is too low to represent the signal bandwidth correctly

AI analysis context

A validated, labeled model is required. Writing statistics cannot identify AI authorship.

Sentence length variation: 0.28 coefficient of variation

Vocabulary diversity: 0.662 type-token ratio

Formulaic expressions: 0 occurrences

Repeated 4-word sequences: 0 repetitions

Interpretation: Source similarity includes properly quoted or cited text. Statistical AI classification cannot establish authorship or identify the originating model. Human review is required for disciplinary decisions. No public-web search is implied by a local-only scan.
